

# Manitoba, South Manson - Prospect Summary

Elcano Exploration is seeking proposals to develop our Lodgepole discovery in South Manson, Manitoba. Elcano drilled an initial test well at 15-22-12-28W1M. Results from the vertical well completion combined with our seismic interpretation support an extensive Lodgepole Fm Daly Mbr oil trend over the lands (~3,000 net acres). All proposals to develop this prospect will be considered. Elcano owns a proprietary 8 square mile 3D seismic program over the prospect.

Lodgepole and Bakken fields surrounding the South Manson prospect area. To view the Canadian Discovery Digest account of Elcano's Hargrave-Miniota Lodgepole discovery visit: <http://www.elcano.ca/operations> At South Manson there are significant Lodgepole oil shows supporting a net oil thickness potential of over 6m in the regionally prolific Daly member (TVD 625m). Lodgepole reserves per horizontal well are estimated at over 100 mbls. Additionally, Bakken fields flank South Manson lands and may be prospective (TVD 700m).

For more information or to schedule a technical presentation and/or seismic review please contact Richard Fulton by email at [rfulton@elcano.ca](mailto:rfulton@elcano.ca) or on cell at (403) 620-2155.
